ADVANCE PRAISE FOR Being Logical

And the fact that mankind is adrift, if not sinking,

"Given the shortage of logical thinking,

It is vital that all of us learn to think straight.

And this small book by D. Q. McInerny is great.

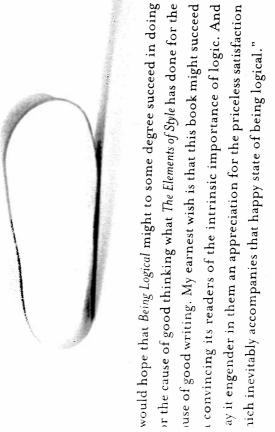

Everybody should not only buy it, but read it." It follows, therefore, since we so badly need it,

-CHARLES OSGOOD

BEING LOGICAL

from Being Logical

#### D. Q. McInerny GOOD THINKING A Suide to

eing logical presupposes our having a sensitivity to language and a knack for its effective use, for logic and language are inseparable. It also presupposes our having a healthy respect for the firm factualness of the world in which we live, for logic is about reality. Finally, being logical presupposes a lively awareness of how the facts that are our ideas relate to the facts that are the objects in the world, for logic is about truth. In this first part of the book I will discuss those attitudes, points of view, and practical procedures whose adoption prepares the mind for a successful engagement with logic.

#### 1. Be Attentive

Many mistakes in reasoning are explained by the fact that we are not paying sufficient attention to the situation in which we find ourselves. This is especially true in familiar situations. That very familiarity causes us to make careless judgments about facts right before our eyes. We misread a situation because we are skimming it, when what we should be doing is perusing it. Often, we assume that a familiar situation will be but a repeat performance of a similar situation will be but a repeat performance. But, in the strictest sense, there are no repeat performances. Every situation is unique, and we must be alert to its uniqueness.

The phrase "to pay attention" is telling. It reminds us

ble to be truly attentive and passive at the same time. Don't just look, see. Don't just hear, listen. Train yourself to focus on details. The little things are not to be ignored, for it is that attention costs something. Attention demands an active, energetic response to every situation, to the persons, places, and things that make up the situation. It is impossijust the little things that lead us to the big things.

### 2. Get the Facts Straight

A fact is something made or done. It has clear objective status. It is something we respond to as having an independent status all its own. It is naggingly persistent, demands recognition, and can be nasty if ignored.

There are two basic types of objective facts, things and etable, or mineral. The White House is an example of the events. A "thing" is an actually existing entity, animal, vegfirst type of fact, and the assassination of Abraham Lincoln of the second. The first type is more basic than the second because events are made up of things or of the actions of things. A state dinner is to be held at the White House. Such an event could not take place were it not for the existence, first and foremost, of the fact that is the White House, and countless other facts as well. In order to establish the factualness of an event, any number of concrete things need to be appealed to.

To determine the reality of a fact that is a thing, all you need do is pay it a visit. If it actually exists it must be somewhere, and, assuming its place to be accessible to you, you can verify its factualness by direct observation. Take the

and there see the White House with your own eyes. That is case of the White House. To ascertain its being a fact, rather than purely imaginary, you can travel to Washington, D.C., the most direct and reliable way to establish its factualness. But you could also rely on indirect evidence: For example, by taking the word of a trustworthy eyewitness that the White House is indeed in Washington, D.C. Or you could decide that photographic evidence is sufficient to establish

We say that is a fact. What is the justification for that claim? It is an event that is over and done with, and there are no living witnesses to the event whom we might consult. Obviously, we did not ourselves witness the event, so direct evidence is out of the question. In this case our approach will be to acquaint ourselves with a variety of things that But what about an event like Lincoln's assassination? serve as indirect evidence of the event. For example, we oirs, diaries, and items in the Congressional Record, all of would consult official documents (police reports, the death which are facts in their own right and whose only reasonable certificate, etc.), newspaper accounts, photographs, memexplanation is the factualness of Lincoln's assassination. On the basis of the factualness of these things, we establish the factualness of the event. And we thus establish a historical Facts can also be thought of as objective or subjective. Both things and events are objective facts. They exist in the public domain and are in principle accessible to all. A subjective fact is one that is limited to the subject experiencing it. A headache would be an example of a subjective fact. If I

am the one experiencing the headache, then I have direct evidence of its factualness. But if it is you experiencing the the reality of subjective facts depends entirely on the trustmust take your word that you have a headache. Establishing headache, I can establish its factualness only indirectly. I worthiness of those who claim to be experiencing them.

evidence, we can confidently establish the factualness of To sum up how we get the facts straight: If a given fact the surest way to establish its factualness is to put ourselves in its presence. We then have direct evidence of it. If we cannot establish factualness by direct evidence, we must indirect evidence we rely upon so that, on the basis of that is an actually existing thing to which we have access, then rigorously test the authenticity and reliability of whatever

There are only a very limited number of significant public events which we can experience directly. This means that, in almost every case, we must rely on indirect evidence. In establishing the factualness of events by indirect evidence, we must exercise the same kind of care we do in establishing the factualness of "things" by indirect evidence. It all comes down to the authenticity and reliability of our sources.

A subjective fact, to the subject experiencing it, is selfevident under normal circumstance. However, through such mechanisms as self-delusion or rationalization, a person could fail to get straight a fact even about himself.

Because the establishment of the factualness of a subjective fact pertaining to another person depends entirely on the trustworthiness of that person, you must first, insofar

as it is possible, establish the trustworthiness of the person in question.

## 3. Ideas and the Objects of Ideas

things, actually existing in a world that is independent of of an objective fact. Clear ideas, then, are ideas that faith-Every idea in the mind is ultimately traceable to a thing, or and apart from the mind. An idea is the subjective evocation fully reflect the objective order from which they derive. Unclear ideas, conversely, are those that give us a distorted representation of the objective world.

solute, it is real. This means that we are not helpless in the face of unclear ideas. To ensure that our ideas are clear, we must vigilantly attend to the relationship between any given idea and its object. If it is a strained relationship, if the connection between the idea and its object is tenuous, then Though the control we have over our ideas is not abwe are dealing with an unclear idea.

It is wrong to suppose that because we know things in the world only through our ideas, it is only our ideas which we really know. Our ideas are the means, not the ends, of our knowledge. They link us to the world. If they are clear ideas, the links are strong. The most efficient way to clarify our ideas is to look through them to the objects they represent.

## 4. Be Mindful of the Origins of Ideas

They are, after all, in a sense our very own babies, the con-We all tend to favor our own ideas, which is natural enough.

ceptions of our minds. But conception is possible in the thinking subject only because of the subject's encounter with the world. Our ideas owe their existence, ultimately, to things outside and independent of the mind, to which they refer: objective facts. Our ideas are clear, and our understanding of them is clear, only to the extent that we keep constant tabs on the things to which they refer. The focus must always be on the originating sources of our ideas in the objective world. We to be self-generating, that is, not owing their existence to do not really understand our own ideas if we suppose them extramental realities.

The more we focus on our ideas in a way that systematically ignores their objective origins, the more unreliable those ideas become. The healthy bonds that bind together the subjective and objective orders are put under great strain, and if we push the process too far, the bonds may break. Then we have effectively divorced ourselves from the objective world. Instead of seeing the world as it is, we see a projected world, one that is not presented to our minds but which is the product of our minds.

When we speak of "establishing a fact," we do not refer to establishing the existence of an idea in the mind. The jective fact. To do so, we must look beyond our ideas to idea in the mind, as we have seen, is a subjective fact, but the kind of fact we are concerned with establishing is an obtheir sources in the objective world. I establish a fact if I successfully ascertain that there is, for a particular idea I have in mind, a corresponding reality external to my mind. For instance, I have a particular idea in my mind, which I label

"cat." Corresponding to that idea are actually existing things in the extramental world called "cats." But I could have another idea in my mind, which I label "centaur" but for which no corresponding fact can be found in the extramental world. For all that, the idea of "centaur" is a subjective fact, since it really exists as an idea in my mind.

#### 5. Match Ideas to Facts

about them, and there would be no word for the idea. I have There are three basic components to human knowledge: first, an objective fact (e.g., a cat); second, the idea of a cat; third, the word we apply to the idea, allowing us to communicate it to others (e.g., in English, "cat"). It all starts with the cat. If there were no real cats, there would be no idea been stressing the general point that ideas (subjective realities) are clear or sound to the extent that they reflect objective realities. And we have said that all ideas have their ultimate source in the objective world. Now we must look more closely at how ideas relate to the objective world, for the relation is not always simple. Next, we must address the question: How are bad ideas possible?

Sometimes there is a direct correlation between an idea this a "simple" idea. Corresponding to my idea of cat is a and an objective fact. Example: the idea of cat. We will call that furry, purring creature which in English we name a cat. In dealing with simple ideas it is relatively easy to test their reliability, because we need only refer to one thing. My idea single, particular sort of entity in the extramental worldof cat is clear and sound if it refers to an actual cat.

We will call "complex" ideas those for which there is no simple one-to-one correspondence between idea and thing. Here the correspondence is one to many. There is more than a single originating source for this kind of idea in the objective world. Let's take the idea of democracy. Is it a clear or a sound one? It is, at least potentially. It is a clear or objective world. But there are many things in the objective sound idea to the extent that we are able to relate it to the world that go together to compose the rich meaning of the dea of democracy: persons, events, constitutions, legislative acts, past institutions, present institutions. If my idea of To prevent my idea from being a product of pure subjecdemocracy is going to be communicable to others, it must refer to what is common to me and to others, those many things in the objective world that are its originating source. tivism, in which case it could not be communicated to others, I must continuously touch base with those many facts in the objective world from which the idea was born.

How are we to explain bad (that is, unclear or unsound) ideas? An idea is unclear or unsound to the degree that it is distanced from and unmindful of its originating source in the objective world. No idea, even the most bizarre, can completely sever its ties with the objective world, but ideas can become so remote from that world that their relation to it is difficult, if not impossible, to see. Bad ideas can be informative, not about the objective world—for they have ceased faithfully to reflect that world—but about the subjective state of the persons who nourish those ideas. Bad ideas do not just happen. We are responsible for them. They result from carelessness on our part, when we cease to pay

sufficient attention to the relational quality of ideas, or, worse, are a product of the willful rejection of objective

### 6. Match Words to Ideas

As we have seen, first comes the thing, then the idea, then the word. If our ideas are sound to the extent that they faithfully represent the thing, they will be clearly communicable only if we clothe them in words that accurately signify them. Ideas as such are not communicable from one mind to another. They have to be carefully fitted to words, so that the words might communicate them faithfully. Putting the right word to an idea is not an automatic process, and sometimes it can be quite challenging. We have all had the experience of knowing what we want to say but not being able to come up with the words for it.

How do we ensure that our words are adequate to the ideas they seek to convey? The process is essentially the same as the one we follow when confirming the clarity and soundness of our ideas: We must go back to the sources of the ideas. Often we cannot come up with the right word for an idea because we don't have a firm grasp on the idea itself. Usually, when we clarify the idea by checking it against its source in the objective world, the right word will come to us.

Sometimes there is a perfect match between word and idea, which would mean a perfect match between word and thing, for if the idea is clear it faithfully represents the thing, and if the word accurately expresses the idea, it would at the same time faithfully identify the thing. This

commonly happens with simple ideas. If I say, "The monument is granite," and the monument to which I refer is in fact granite, then in "granite" I have the perfect match for the idea and the thing it represents. It gets more complicated when we are dealing with complex ideas, but the general principle remains the same: In order to guarantee accuracy in your use of words, go back to the objective facts that are the foundational explanations for words.

In the effort to come up with words that accurately convey ideas, our ultimate purpose should always be this: to so shape our language that it communicates to others the way things actually are—objective reality. It is not enough that language be satisfied with ideas as such, but with clear and sound ideas: Let us say I fervently hold to the real existence of Lilliput, and have all sorts of ideas about it. I may be able to come up with scads of words that accurately convey those ideas to you, but all those words do is reveal the state of my mind. They do not reveal the state of the world. They deal with subjective reality, not objective reality.

### 7. Effective Communication

Language and logic are inextricably bound up with each other. How that is so becomes clear when we recall the relationship between the idea and the word. Although it is a disputed point among the experts, it seems possible that we can hold an idea in our mind without having a precise word for it. In any event, if we are going to attempt to communicate an idea to others, it is imperative that we express it by a word. And, as we have seen, the better the fit between word

and idea, the clearer and more effective the communication of the idea.

in communication. The next step is putting ideas together to form coherent statements. If I said to you "dog" or "cat," Matching words to ideas is the first and most basic step your response would be expectant, waiting to hear more. You would wonder, What about dogs or cats? Through the but you don't know what I intend to do with those ideas. I'm simply "saying" the ideas; I'm not saying anything about them. We say something about ideas when we put them totively or negatively. Notice that if someone simply says "That's true" or "That's false." But if someone says something about a dog—"The dog is in the garage"—then such a words I'm speaking, you know the ideas I'm dealing with, gether to form statements that can be responded to affirma-"dog," there would not be much sense in responding with meaning in logic. It is a linguistic expression to which the response would be appropriate. "Statement" has a special response of either "true" or "false" is appropriate.

Words have been called the building blocks of language, but it is the *statement* that logic starts with, for it is only at the level of the statement that the question of truth or falsity is introduced, and logic is all about establishing what is true and distinguishing it from what is false. It can sometimes be tough enough determining whether a statement is true or false when that statement is clearly understood. But if we have difficulty understanding what a statement is attempting to say, then our difficulties are compounded, because we have to figure out the meaning of the statement before we can get on to the main business of determining whether it is

true or false. Thus the importance of clear, effective com-

if it is not first clear in my own mind? However, clear ideas It is impossible to have clear communication without clear thinking. How can I give you a clear idea of something do not guarantee clear communication. I may have a perfectly good idea of what I'm trying to say, but can't succeed in getting my ideas across clearly and effectively.

Here are some basic guidelines for effective communi-

#### Don't assume your audience understands your meaning if you don't make it explicit.

The more complicated the subject matter dealt with, the more important this point is. We sometimes take it for granted that an audience is aware of background information that is necessary for a correct understanding of the subject we're speaking on, but in fact the audience may be quite innocent of this information. When in doubt, spell out the background information. It is always better to err on the side of saying too much than on the side of saying too

#### Speak in complete sentences.

The sentence with which logic is most concerned is the declarative sentence. A declarative sentence is the same thing as a statement (also called a "proposition" in logic). If I say "Dog turtle," "Falling stock prices in July," "The building's Indiana limestone facade," you could presume I am intending in each case to link certain ideas together, but

"The dog bit the turtle," "Falling stock prices in July depressed Julian," "The building's Indiana limestone facade you do not know how. That is because I am not forming genuine statements. I need to speak in complete sentences: was severely defaced by the vandals."

#### Don't treat evaluative statements as if they were statements of objective fact.

selves to a simple true-or-false response. We must not invite inwarranted responses to statements, which is just what we do when we attempt to pass off an evaluative statement as if jective fact are not open to argument; evaluative statements true or false. "The Pearce Building is ugly" is an evaluative statement, and as such it combines both subjective and obective elements. Evaluative statements do not lend themit were a statement of objective fact. True statements of obare. If I want an evaluative statement to be accepted, I must Adams" is a statement of objective fact, and as such it is either "The Pearce Building is on the corner of Main and

#### Avoid double negatives.

double negatives. Instead of saying, "It is not unlikely that In Spanish, double negatives have the effect of intensifying the negative import of a sentence. In English, double negatives cancel each other out, making the sentence affirmative. This can sometimes cause confusion, since the sentence sounds negative but is in fact affirmative. To avoid that confusion, and for greater clarity of expression, avoid she would be welcome," say "She would be welcome.'

### Gear your language to your audience.

If you are a physicist discussing the principle of indeter-But if you are asked to explain that principle to a group of minacy with other physicists at a professional conference, you can freely use the technical jargon of your profession. nonphysicists, you should adjust your vocabulary and present your material in ordinary language. Don't use technical or "insider" language merely to impress people. The point is to communicate. The two extremes to be avoided are talking down to people and talking over their heads.

An important point to note here is that we obviously cannot attune our language to our audience if we do not know our audience. The first order of business, then, is to have a reasonably good sense of the composition and background of the group you will be addressing,

## 8. Avoid Vague and Ambiguous Language

Vagueness and ambiguity are specific instances of the kind of language that can inhibit clear and effective communication. The word "vague" comes from the Latin adjective vagus, which means "wandering," while the word "ambiguous" traces its origin to the Latin verb ambigere, which means "to wander about." Vague and ambiguous words and expressions wander about among various ideas instead of settling definitely upon one or another particular idea. They all share the defect of not having a fixed, unmistakable

A word is vague if its referent is blurred. We do not know precisely what the word is pointing to. Consider the

tain of what is being talked about for lack of precise information. For those statements substitute these: "People who have been trained at the San Francisco Conservatory of Music don't like West Cork folk music." "The Candidate Selection Committee for the People's Party says he will not two statements "People don't like music like that" and "They say he will not run for a second term." A natural response to the first statement would be: "What people, and what kind of music?" A response to the second statement might be: "Who are 'they'?" In both instances we are uncerrun again." Now we have something more definite to re-

sure preventative against vagueness, then, is to make your words as precise and sharply focused as possible. Your reader or listener should not be forced to guess at exactly cate information specifically about rocking chairs, or antique specific terms rather than the more general "chairs." Usu-As a rule, the more general the word, the vaguer it is. A what your words are pointing to. If you mean to communichairs, or dentist's chairs, or electric chairs, then use those ally the context in which a general term appears will allow your audience to figure out its referent, but if you have any doubts about that, use a specific term.

"good," and "evil" can be vague, not because they have no imple—and understand it in quite different, perhaps even contradictory, ways. That is why it is imperative, in using Terms like "love," "democracy," "fairness," "equality," meaning but because they are especially rich in meaning, Thus, two people can use the same term-"love," for exterms of this sort, that you make explicit your understand-

ing of them. Before you attempt to persuade an audience that a certain situation is unfair, tell them what you mean by unfairness.

An ambiguous term ("equivocal," in the language of logic) is one which has more than a single meaning and whose context does not clearly indicate which meaning is intended. A sign posted at a fork in a trail which reads BEAR TO THE RIGHT can be understood in two ways. The more probable meaning is that it is instructing hikers to take the right trail, not the left. But let us say that the ranger who painted the sign meant to say just the opposite. He was trying to warn hikers against taking the right trail because there is a grizzly bear in the area through which it passes. The ranger's language was therefore careless, and open to misinterpretation that could have serious consequences. The only way to avoid ambiguity is to spell things out as explicitly as possible: "Keep left. Do not use trail to the right. Grizzly bears in the area."

### 9. Avoid Evasive Language

You should always be so straightforward in your language that it would be impossible for any reasonably attentive audience to miss your meaning. This is not to suggest that you have to use words like sledgehammers. One can be perfectly clear without being either crude or cruel.

There is a place for euphemism in language. But we have to be careful that euphemistic usage doesn't become a way of evading what really is at issue. Consider a term like "final solution," which was used to disguise a heinous pro-

gram for exterminating an entire people. The problem with evasive language, language that does not state directly what a speaker or writer has in mind, is twofold. First, and obviously, it can deceive an audience. Second, and more subtly, it can have a deleterious effect on the people who use it, distorting their sense of reality. The user shapes language, but language shapes the user as well. If we consistently use language that serves to distort reality, we can eventually come to believe our own twisted rhetoric. Such is the power of language. At first hearing, terms like "cultural revolution" and "reeducation" might sound quite harmless. Then one learns that they masked totalitarian brutality at its worst.

It is juvenile to use language simply to shock. But shocking language is preferable to evasive language, if it can disabuse people of hazy ideas and acquaint them with the truth.

#### 10. Truth

The whole purpose of reasoning, of logic, is to arrive at the truth of things. This is often an arduous task, as truth can sometimes be painfully elusive. But not to pursue truth would be absurd, since it is the only thing that gives meaning to all our endeavors. It would be equally absurd to suppose that truth is something forever to be pursued but never to be attained, for that renders our activity purposeless, which is to say, irrational, and turns truth into a chimera.

Truth has two basic forms. There is "ontological" truth and "logical" truth. Of these two, ontological truth is the more basic. By ontological truth we refer to the truth of

true, then, if it actually exists; it has real being. The lamp being or existence. Something is said to be ontologically sitting on my desk is ontologically true because it is really there. It is not an illusion. The opposite of ontological truth is nonexistence.

truth is simply the truth of statements. More broadly, we Logical truth, as you might suspect, is the form of truth we are most directly concerned with as logicians. Logical could say that it is truth as it manifests itself in our thinking carefully, for it is going to prove very important in all that and language. Let us examine the notion of logical truth

Recall the definition of a statement, given earlier: a linwould be appropriate. To affirm a statement is to declare it guistic expression to which the responses "true" or "false" to be true; to deny it is to brand it as false.

A statement is true if what it says reflects what is the The statement is true if there really is a boat, there really is a pier, and the boat is really tied to the pier. What a true case. Consider the statement "The boat is tied to the pier." a correspondence between ideas in the mind (subjective statement does is declare, through the medium of language, "The boat is tied to the pier" would be false if there were a discrepancy between what it says and what actually is the facts) and real states of affairs in the world (objective facts).

Establishing the truth in any particular situation is a matter of determining whether what one believes to be true, or suspects might be true, has a basis in fact. It is a matter of bringing together into harmonious juxtaposition the

subjective and the objective. But the focus of attention here must be on the objective order of things. If I am uncertain it will not help me to resolve the issue if all I do is reflect upon my own ideas on dogs and garages and the various ways they can be related to one another. I have to go out and check the garage. It should be clear now why we said that of the two forms of truth, ontological and logical, the former is about the truth of the statement "The dog is in the garage," more basic. What determines the truth or falsity of a statement is what actually exists in the real world. Logical truth, in other words, is founded upon ontological truth

ical problem than a logical one. When I lie, I have no doubts about an actually existing situation in the real world, but in my statement about that situation I consciously and deliberately contradict my own knowledge. I know the situation to A word in passing about lies. Lying is more a psychologbe properly expressible in the form "A is B," but my statement says "A is not B."

Logical truth, as we have seen, is a matter of a correflects the ideas held by the person making the statement) and objective facts. This understanding of the nature of theory of truth." Another theory, the "coherence theory of spondence between the content of a statement (which retruth, not surprisingly, has been called the "correspondence truth," is subordinate to the correspondence theory.

The coherence theory of truth maintains that any given statement is true if it harmoniously fits into (is coherent with) an already established theory or system of thought. Take, for example, Einstein's Special Theory of Relativity. It is concluded that a particular statement about the nature

of the physical world is true because what it says is consonant with the Special Theory of Relativity. What would make such a conclusion a logically responsible one is the fact that the Special Theory of Relativity itself, as a theory, reflects the way the physical world actually is. There is a correspondence between the theory and objective reality. We can see, then, that the coherence theory of truth, if responsibly applied, depends upon the correspondence theory of truth, which remains foundational.

We should be aware, though, that the coherence theory of truth can be seriously abused, which would be the case if a statement is judged to be true merely by virtue of the fact that it fits into an established theory or system of thought that itself does not correspond with reality, or does so only questionably. For example, if Marxist economic theory can be shown to be dubious, then the claim that a certain statement about economic matters is true because it is consonant with that theory is likewise dubious.
